Model vs Kalshi

Swing from 2024

Tipping-point districts

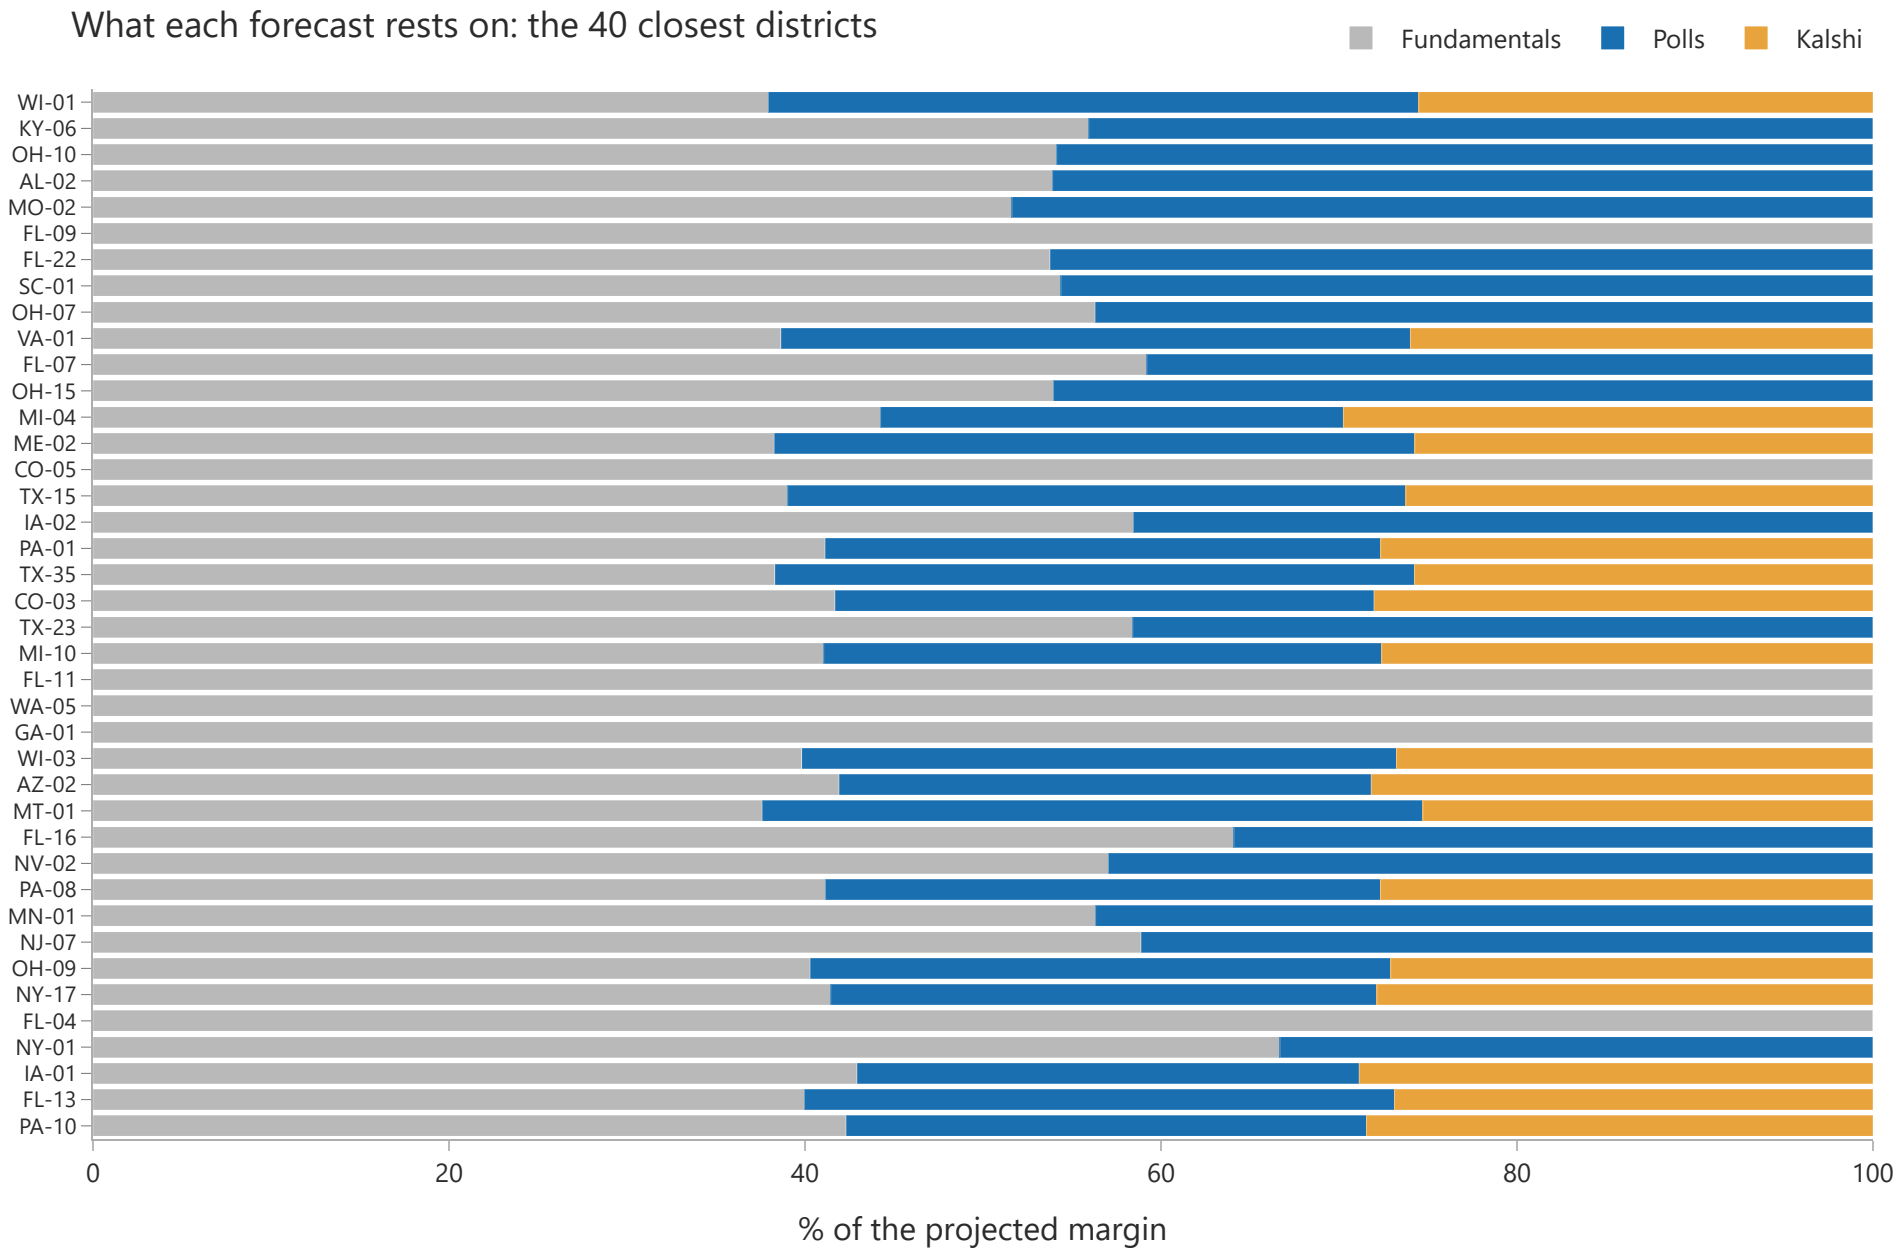

In each simulation the districts are ranked from best to worst for Democrats; the one that delivers seat 218 is that simulation's tipping point.

- Checks: 14 PASS | 1 WARN | 0 FAIL (details in model_warnings.xlsx).
- Data: votehub_house live, votehub_generic_ballot live, votehub_approval live, kalshi_house_races live, kalshi_national live.
- Districts: 2024 presidential results on the 2026 lines (The Downballot); incumbents, open seats and nominees as of Nov 2, 2026 (Wikipedia, Ballotpedia, 270toWin); see House Forecast/Data/build_house_districts.py.
- Louisiana holds an all-party primary on Nov 3 (runoff Dec 12); its seats are forecast by party. AK-AL is Bill Hill (independent) vs Nick Begich (R): Hill is read from the polls and from 1 - Kalshi's Begich price, and a Hill win counts for Democrats in 80% of simulations. CA-06 is Richard Pan (D) vs Kevin Kiley (independent); a Kiley win is not a Democratic seat. Missouri uses its 2022 map.

Key settings

Poll source	VoteHub API (us-representative + generic ballot + approval)
Poll age	all polls, half-life 7 days
Polls : fundamentals : Kalshi	Bayesian precision (poll floor 5.6, prior SD 6.6); Kalshi precision 1/8^2, longshot-corrected, conversion SD >= 7.26
Fundamentals	1.78 x partisan lean (2024 pres., 2026 lines) + national environment (generic-ballot blend 0.75)
Incumbency	4.5 pts for an incumbent running in the district
LV : RV : A	1 : 0.85 : 0.7; RV shift +1.2 (measured)
Flooding penalty	1/k^0.5
House effects	in-cycle, shrunk to scorecard (k 5)
Ungraded pollsters	random
National signals	VoteHub polls + Kalshi averages (= 5 polls)
Kalshi races	Bayesian input + comparison (found automatically)
Source errors	correlated (rho 0.3); sims: national 3.4 + region 2.7 + state 2.4 + district, in pts
Single-party races	uncontested / same-party top-two seats counted as certain

Equations and weights

1. WEIGHT OF EACH POLL

$$w = 0.5^{\text{age}/7} \times \left(\frac{\min(n,\,2500)}{800}\right)^{0.5} \times w_{\text{pop}} \times w_{\text{partisan}} \times w_{\text{generic}} \times w_{\text{field}} \times w_{\text{quality}} \times w_{\text{accuracy}} \times \frac{1}{k^{0.5}} \times \frac{1}{\text{versions}}$$

Population: LV 1, RV 0.85, adults 0.7. Partisan sponsor 0.6. Generic-party question 0.5. Full field 0.9. Quality 0.5 to 1 by VoteHub grade (ungraded firms get a random graded firm's grade in each simulation). Accuracy kept between 0.5 and 2. k = the pollster's polls of that district.

2. EACH POLL'S MARGIN

$$m = (D - R)\,\frac{D + R + U}{D + R} + s_{RV} \pm s_{\text{partisan}} - h, \qquad h = \frac{\sum \text{residuals} + 5\,h_{\text{scorecard}}}{n_{\text{polls}} + 5}$$

U = undecided. RV shift s_RV = +1.16 pts (measured from LV/RV pairs). Partisan shift = 3 pts against the sponsor. Residual = poll minus the same district's average of other pollsters.

3. POLLING AVERAGE

$$\bar{m} = \frac{\sum w\,m}{\sum w}, \qquad SD_{\text{polls}} = \sqrt{\frac{SD_{\text{poll}}^2}{n_{\text{eff}}} + 5.62^2 + SD_U^2}$$

The middle term is the error all polls of a district share (calibrated on House polls 1998-2022).

---

4. NATIONAL ENVIRONMENT

$$\text{env} = 0.75 \times \text{GB} + 0.25 \times 0.35 \times (-\text{net approval})$$

GB = generic ballot (VoteHub polls blended with Kalshi's average). This run: env = D+9.3.

---

5. PRIOR (FUNDAMENTALS)

$$\text{prior} = 1.78 \times \text{lean} + \text{env} \pm 4.51\,[\text{incumbent running}], \qquad SD_{\text{prior}} = 6.56$$

lean = (district 2024 presidential margin - national margin) / 2, on the 2026 lines. Slope, incumbency and SD measured on the 2018 and 2022 House midterms.

---

6. KALSHI

$$P' = \text{logistic}\,(1.15 \cdot \text{logit}\,P), \qquad \text{margin}_K = \Phi^{-1}(P') \cdot \max\,(7.26,\ SD_{F+P}), \qquad SD_K = 8$$

Used only when 6% <= P <= 94%. P = D price / (D price + R price).

---

7. EACH DISTRICT

$$\text{margin} = \frac{\pi_F \cdot \text{prior} + \pi_P \cdot \bar{m} + \pi_K \cdot \text{margin}_K}{\pi_F + \pi_P + \pi_K}, \quad \pi = \frac{1}{SD^2}, \quad SD^2 = \frac{1}{\Pi} + \frac{2(0.3)}{\Pi^2}\left(\sqrt{\pi_F\pi_P} + \sqrt{\pi_F\pi_K} + \sqrt{\pi_P\pi_K}\right) + 0.76^2 \cdot \text{days left}$$

Pi = the sum of the three precisions.

---

8. SIMULATIONS

$$\tilde{m}_i = \text{margin}_i + N + R_{g(i)} + S_{s(i)} + L\,f_i + e_i, \qquad \text{D seats} = \text{certain D seats} + \sum_i \mathbf{1}[\tilde{m}_i > 0], \qquad P(D \geq 218)$$

N = national miss (SD 3.35, t df 8). R = Census-region miss (SD 2.68). S = state miss (SD 2.42). L = lean factor (SD 1). e = the rest of the district's SD (t df 10.9). Uncontested and same-party races are certain seats.
